We have been informed about STANDARDFLEX: A novel energy management system and flexibility market centric smart grid architecture that standardizes and vertically optimizes flexibility exploitation through digital, intelligent, and integrated energy services, which will be submitted under the specific call HORIZON-CL5-2022-D3-01-12: Replicable solutions for a cross sector compliant energy ecosystem of the Horizon Europe framework program.

We would like to express our support for the project, as we find it important to further investigate the provision of flexibility to Danish markets, particularly as an instrument to facilitate local sector coupling and flexibility trading, and thus support the green transition.

We expect to engage with the project partners to exchange views on how flexibility can be optimally integrated in the distribution system and share knowledge on which conditions that needs to be fulfilled for the community to provide value to the power distribution system. We are looking forward to interacting with STANDARDFLEX to exploit its proposed digital services.

We offer to participate in an advisory board to support perspectivation and scaling of the project results. Further, Radius is willing to support the project with data for validation and reviewing of pilot results.

Best regards
Radius

Mads Paabøl Jensen
