ENERGINET SUPPORT STANDARDFLEX

Date:
24th April 2022

Author:
TRM/HBR

We have been informed about STANDARDFLEX: A novel energy management system and flexibility market centric smart grid architecture that standardizes and vertically optimizes flexibility exploitation through digital, intelligent, and integrated energy services, which will be submitted under the specific call HORIZON-CL5-2022-D3-01-12: Replicable solutions for a cross sector compliant energy ecosystem of the Horizon Europe framework programme.

We support STANDARDFLEX and we are convinced that it will have a significant impact in the provision of flexibility to Danish ancillary service markets, mainly markets for reserve capacity. Flexibility from the classical consumption is still very limited, especially in the explicit markets for reserves. We will support with knowledge sharing, data and communication with STANDARDFLEX consortium to provide requirements and plans of the TSO in Denmark towards the use of aggregated flexibility. We are looking forward to interacting with STANDARDFLEX to exploit its proposed digital services.
